**Attach:** Arsenic Above PEL 11103.doc  
**Subject:** Fw: Arsenic Situation

Elan & Shimon:

Please review the attached report from Paul Jackson. As you will see the lead paint levels are normal for the demolition process we are using. However, we have encountered high Arsenic levels in the analysis Mr. Jackson has taken. This is a unforeseen condition of which we were not aware of when we put our pricing together for this project. We have put our employees in extra protective respiratory protection and added more ventilation to the work areas. Because of the air sampling above the permissible exposure limit (PEL) for the arsenic we may have to suspend the current work being done and establish additional measures such as isolating the work by establishing barriers in each area, install additional ventilation equipment, slow down on the plasma cutting process and HEPA vacuum all surfaces that have been contaminated with arsenic. All these items will cause additional costs not originally identified in our proposal and we will need to seek additional monies for this additional work. I don't like to ask for change orders but this is truly an unforeseen condition which could affect everyone within the facility. Also, Labor & Industries is asking for our air monitoring records for this project. Please call or email me back so that we can discuss this issue and move forward with the work. Would you please pass this information onto Hertz. We need to move on this issue quickly and I appreciate you working with us on this issue.
